

# Shoulder to shoulder across borders: Light Vehicle 2025 Demonstrators

1

**# Body module**  
e.g. bonnet, door

Demo Leader:  
Jean-Pierre Heijster, Automotive NL

2

**# e-Powertrain module**  
e.g. gearbox housing

Demo Leader:  
Ioanna Koutla, Université de Liège

3

**# Suspension module**  
e.g. AM-consolidated parts

Demo Leader:  
Jan Stroobants, Flanders Make

4

**# Hydrogen tanks**  
For fuel cells

Demo Leader:  
Dr. Michael Effing, AMAC

✓ **We have chosen four demonstrators**

**Project Partners**

**Co-Financers**

# Gearbox housing. Why?

- High demand in reducing weight in EV.
- Excellent opportunity to try and reduce weight in powertrain.
- Excellent opportunity to reduce CO<sub>2</sub> emissions, while the whole Life Cycle Assessment of electric vehicles (from cradle-to-grave) is under research.
- Excellent opportunity to combine the existent capabilities in EMR, throughout the whole value chain.

# Application example: All types of EV

## Characteristics:

- ☐ The gearbox housing is generally comprised by two symmetrical halves of molded aluminium.
- ☐ Only one half is studied.
- ☐ Traditional material : Aluminium
- ☐ Proposed application : Aluminium & plastic (PA6 compounded with SMA - styrene maleic anhydride).
- ☐ Lifetime comparable to that of a usual gearbox housing.

# Application example: All types of EV

## Simplified version:

- Simplifications are made to eliminate parts that give no additional information.

30%Al / 70%plastic

50%Al / 50%plastic

- *Topology Optimization* is used as a tool to investigate the best allocation of each material in the final design.
- A new design taking into consideration the TO results and manufacturing constraints is the following step.

# Objective of the Demo Project

The objective of this demo project is:

- ☐ To create a multi-material gearbox housing which will be lighter than the traditional one made only of aluminium.
- ☐ To reduce the CO<sub>2</sub> emissions during the life cycle.
- ☐ To create a lighter part in powertrain where it is already difficult to reduce weight.
- ☐ To acquire a generic part and showcase that the research behind it's development can be applied for the development of similar parts in several vehicle types.

# Scope of the project

- ☐ Simulation of injection overmolding production method.
  - FE-Modelling / Meshing
  - Injection Molding Analysis
  - Determination of a suitable gating concept
  - Evaluation of the general filling behavior
  - Determination of the shrinkage and warpage based deflection behavior
  - Checking of construction issues and (if needed) optimization instructions
  
- ☐ Vacuum casting production method
  - Print master parts in SLA (epoxy resin)
  - Create the metallic part using a sand mold
  - Create a silicon mold using the metallic part in it, cast resin in the mold, simulating the injection overmolding.
  - Result quite close to that of injection overmolding.

# Expected deliverables

- ❑ A virtual prototype using the simulation of injection overmolding production method.
  - Results from a rheological point of view
  - Adhesion between the two materials
  
- ❑ A physical prototype using the vacuum casting production method.
  - Physical representation of the two material gearbox housing
  - Possibility to produce more prototypes and perform testing
  
- ❑ Life Cycle Assessment for the existing part, LCA for the part produced with the injection overmolding method and comparison to showcase the percentage of CO<sub>2</sub> emissions reduction.

# Project planning

Define the shedule of your demo Project using the icons below the table:

	Jan-20	Feb-20	Mar-20	Apr-20	May-20	Jun-20	Jul-20	Aug-20	Sep-20	Oct-20	Nov-20	Dec-20	Jan-21	Feb-21	Mar-21	May-21	Jun-21
